

Application for Subsidized Club Tests

It is easy to become part of the project to improve the availability of clean stock for your local ADS society. The first step is to pick a project manager willing to organize the sample testing process this summer and then to manage the propagation and sale of the known clean stock next spring. The project manager should identify a small number of growers in the club who will 1) provide good looking stock for testing and 2) be willing to donate most of the tubers from the clean plants for propagation and sale the following spring. In order to be most successful in yielding clean test results, those growers also need to be prepared to follow the disinfection practices described in the December 2018, ADS Bulletin.

To apply for the project, please email the following information to baronminer@aol.com before July 31: Name of the Club, Project manager, Project manager's email address, and Preferred sampling date: late August, early September, late September. I will provide a sample submission date once we have all the applications available.
